

**ABSTRACT**

A method and system for remote operator interface with a self-service transaction terminal, such as an ATM makes use of a set of web based applications for operator functions to enable the remote operator to access the operator functions over a standard browser from a remote operator interface client PC. Each ATM with which the remote operator interface is used has a set of web based applications that supports the operator functions. The operator accesses the ATM from the client PC by bringing up the browser and entering a URL to point to a specific ATM. The remote operator interface supports a plurality of supervisory type functions and enables the user to administer a plurality of ATMs for which it is configured to allow the particular functions to be performed. Communication via the remote operator interface is secure over a private network or virtual private network (VPN) over the Internet. The remote operator must be authenticated to gain access, and the operator's entitlements may limit access.
